

APPENDIX B

Journal Ranking and Average Impact Factors of Basic and Allied Sciences

Version July 2000

created by Acad. Prof. Dr. Ioan-Iovitz Popescu
based on all annual data sets of SCI-JCR (1974-1998)

MOTTO:

*"There is something still worse, however, than being either criticised or dismantled by careless readers: **it is being ignored**. Since the status of a claim depends on later users' insertions, what if there are **no** later users whatsoever? This is the point that people who never come close to the fabrication of science have the greatest difficulty in grasping. They imagine that all scientific articles are equal and arrayed in lines like soldiers, to be carefully inspected one by one. However, most papers are never read at all. No matter what a paper did to the former literature, if no one else does anything with it, then it is as if it never existed at all. (Latour, 1987, p. 40)".*

FOREWORD

Bibliometric indicators currently used to examine and evaluate the published knowledge production are primarily based on impact factors of journals covered by *Science Citation Index* database and published annually since 1975 in the *Journal Citation Reports* [Garfield (Editor)]. This concept has been introduced by Garfield [Garfield, 1972, 1979] as a measure of the average citation frequency for a specific citable item (article, review, letter, discovery account, note, abstract) in a specific journal during a specific year or period. Commonly, the impact factor of a journal is defined as the ratio between citations and recent (previous two years) citable items published, or, in other words, as the average number of citations in a given year of articles published in that journal in the preceding two years. Thus, for instance, the impact factor for 1990 of *Physical Review Letters (PRL)* has been calculated as the cumulated number of 22,007 citations received in 1990 for articles published in the considered journal in 1988 (11,497 citations) and 1989 (10,510 citations), divided by the cumulated number 2901 (in 1988 + 1989) = 1430 (in 1988) + 1471 (in 1989) of citable articles published in that journal during the same two-year period; the impact factor of *PRL* in the year 1990 results then from the ratio 22,007 citations / 2901 papers = 7.586 citations per paper and has the meaning of number of citations received by the "average *PRL* article" during the considered two-year period. Obviously, the definition can be extended over longer time spans. For more detailed recent information about impact factors and their applications, see also *ISI Essays* [Garfield, 1994; Katz].

Developed originally from the need to compare the journal influence or performance, the impact factor provides nowadays the main quantitative tool for ranking, evaluating, categorising, and comparing journals. Thus, it provides librarians a tool for the management of journal collections and publishers a quantitative evidence in evaluating the position of their journals. But data can as well be ranked to reveal interesting facts about individual or collective performance and trends, such as highly cited papers and authors (*hot papers, hot scientists*), most active laboratories, institutions or research fronts [Garfield, 1994], up to countries and world science mapping and policy [Garfield, 1994; Katz; Braun].

"Perhaps the most important and recent use of impact is in the process of academic evaluation. The impact factor can be used to provide gross approximation of the prestige of journals in which individuals have been published. This is best done in conjunction with other considerations such as peer review... Again, the impact factor should be used with informed peer review" [Garfield, 1994]. Methods and techniques are currently designed for evaluation and comparison of research groups and individual scientists, such as the so called ISI's *Expected Citation Rates (ECR) System* [Garfield, 1994]. A simple scientometric evaluation criterion of individual contributions in fundamental science has recently been proposed [Popescu, 1994] and successfully tested for promotion thresholds in physics research institutes and faculties [MNE, 1999]. Thus, a particularly direct and transparent cumulative scientometric indicator appears to be *the sum of the (journal impact factor, q_i) / (article author number, a_i) ratio* or, shortly, $\Sigma (q_i/a_i)$, extended over the whole list (assumed statistically significant) of scientific publications of the assessed individual. Obviously, this *individual cumulative factor* has the meaning of author's total number of citations per author in the first two years after publication and, consequently, its unit is *cites/author* at this paper age. Similarly, the average journal impact factor pertaining to an author, $\Sigma (q_i/a_i)/\Sigma (1/a_i)$, is a measure of his number of citations per published paper, with the corresponding *cites/paper* unit.

Clearly, a high number of citations means a major impact in the specific field or a high utility. However, it is critical to take into account, among other aspects, that publication and citation rates, as well as the peak impacts, vary widely from field to field, and among different disciplines, and we need to know what the average citation rate is within a field and a discipline to assess an individual. A convenient way to consider this requirement consists in the use of *the relative ranking number, r_i* , of the journal within its discipline instead of the impact factor, q_i , as far as, according to the *Lavalette ranking law* [Lavalette, 1996; Popescu, 1997], there exists a simple functional dependence between them, namely $q_i = \alpha [(N+1)/r_i - N] - \beta$, where α and β are two fitting parameters, N is the total number of journals in the considered discipline, and $r_i = (N - n_i + 1)/N$ is the relative ranking number, corresponding to its (descending) ranking number n_i . Thus, for instance, a value $r_i = 0.75$ means that 75 % of journals of the considered discipline have a relative ranking number (and the corresponding impact factor) lower or equal to that of the considered journal. Our recommendation for interdisciplinary comparisons and evaluations consists in the use of the *individual cumulative relative rank $\Sigma (r_i/a_i)$* , with its natural unit *relative rank*, rather than $\Sigma (q_i/a_i)$ *cites/author*. The major advantages of this replacement consist in (i) a bibliometric equivalence of journals belonging to various disciplines but having the same relative ranking number, besides (ii) a much higher stability as compared to the corresponding impact factor.

In order to meet the increasing needs of journal impact factors for a variety of purposes, this work presents a completed and updated version of the previous one (Popescu, version December 1999) and consists in a selection from *SCI Journal Citation Reports* of almost 6000 journals of general and special interest to scientists engaged in physics, mathematics, chemistry, and related engineering and life sciences. This version covers all available journal impact factors along 24 years in the window 1974-1998, except the missing (not edited) 1976 year. Thus, below are given the tables containing average impact factors (rounded to two decimals) of 6 fields (Table 1), 55 disciplines (Table 2), and 5762 journals (Table 3). For convenience, Table 3 shows the discipline and journal rank (JRK) at the left of the journal title column, and the average journal impact factor (JIF), standard deviation (DEV) and the number of years of ISI quotation (YRS) at right. Generally, the journal relative ranking $r_i = (N - n_i + 1)/N$ ranges from unity (for top journals) to $1/N$ (for bottom journals), so that various discipline and field average relative rankings are close to $1/2$. Also, the overall science average impact factor is about unity. Thus, according to Table 1, the average field rank (FRK) is 0.55 whereas the average field impact factor (FIF) is 1.11. Due to this circumstance, the promotion, appointment, and accreditation thresholds in **the ranking $\Sigma (r_i/a_i)$ scale** should be **roughly half** of those established in **the cites $\Sigma (q_i/a_i)$ scale**. Also, in the available 24 years window of ISI quotation, the average journal lifetime amounts close to one half thereof (12.1 years). A further edition of the present work will contain in addition the complete annual distribution of journal impact factors showing the "ever-changing river of journals". Though far from perfect, the new indicators proposed here allow to examine several key facets of an important part of individual and collective knowledge production.

JRK = Journal Rank

JIF = Average Journal Impact Factor

DEV = Standard Deviation

YRS = Number of Years of ISI Quotation

NOTE 1: For YRS = 1 one enotes DEV = 0

NOTE 2: + (**plust sign**) following some abbreviated journal titles indicates combined original (mostly Russian) and English translation
